# The Champion Brands

## Champion Professional Grade Cutting Tools

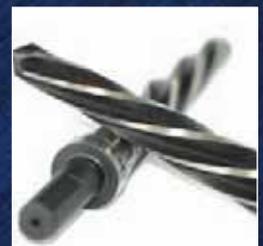

Champion cutting tools are as sophisticated as the machines that run them. Material selection, metallurgy and tool geometry are engineered to give you dependable performance and long life.

Champion brand twist drills are more than just "drill bits". From screw machine drills to taper shank drills, Champion twist drills are manufactured to exacting standards that yield the lowest cost per hole.

The Champion range of taps will give you close tolerance threads in a variety of applications, including both high speed tapping heads and hand use.

All Champion carbide burs are titanium nitride coated for long life and high performance.

The range of reamers available includes bridge reamers, adjustable hand reamers, chucking reamers and chassis reamers. When you need to align, enlarge or debur holes you can count on Champion reamers.

The Brute drill was developed to outperform costly cobalt drills. It penetrates faster and is more flexible, so Brute drills break less and last longer.

The Brute family is rugged. All Brute Platinum drills, taps, reamers, countersinks and end mills are engineered for tough materials and environments.

The combination of quality raw materials, geometries and surface treatments provide consistent high quality for predictable and repeatable high performance.

XL5 jobber drills, XL28 mechanics length drills, and XL8 metric jobber drills all feature NOMO (Nitride on Margin Only) surface treatment.

According to our customers, nitriding simply makes our Brute drills work better!

Brute Platinum Drills are the **ultimate workhorse** for virtually any drilling application.

# The Champion Brands

Champion's RotoBrute system is the quick and easy holemaking solution for making large diameter holes in structural steel beams and plate.

The RotoBrute drilling system features a complete line of magnetic drill presses and annular cutters, which are engineered to drill large diameter holes in structural steel from 7/16" to 4" diameter.

Champion magnetic drill presses may be used in any position; vertical, horizontal or overhead. It allows you to take the magnetic drill to the workpiece, instead of bringing the workpiece to the drill press.

At the core of the RotoBrute system is the broadest range of carbide tipped and high speed steel annular cutters which feature our exclusive Plus20 surface treatment. Plus20 provides cleaner cuts, positive slug ejection and long tool life.

The RotoBrute range of carbide tipped annular cutters now includes CT300 3" depth hole cutters and CT400 4" depth hole cutters. Both are recommended for thick materials and extended reach in square tubing.

# Jobber Drills

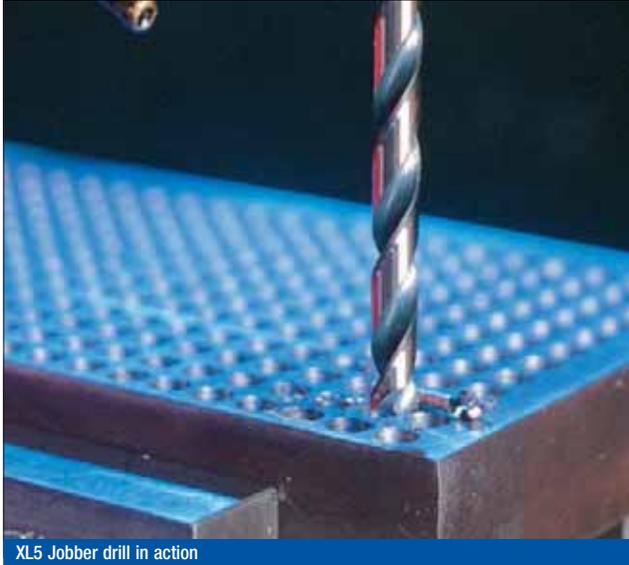

## List No. XL5

Straight Shank / Heavy Duty / Black & Bright Finish /  
135° Split Point / NOMO® Surface Treatment / HSS

**Description:** Unique web geometry, especially useful in portable drilling of stainless steel, titanium alloys, and other hard to drill materials.

**Application:** Steel erection, mining, heavy construction. Used in a wide range of manufacturing plants, vehicle, railway and dockyard maintenance.

XL5 Jobber drill in action

Field tests have proven Brute Platinum XL5 drills penetrate faster than cobalt. Users state lower fatigue levels, since less force is required to drill. Less breakage is also reported due to its unique "toughness: hardness" ratio, enabling them to flex when cobalt drills chip or snap.

Precision ground 135° split point eliminates the need for pilot hole drilling. Prevents "walking" and bites right into #300 and #400 series stainless steels.

## Titanium Nitride Coated Jobber Drills

### List No. 700T

Straight Shank / 135° Split Point\* / HSS

**Description:** Titanium Nitride coating provides a surface hardness in excess of 80 Rockwell C scale, protecting the cutting edge from abrasion, and a protective shield against damaging heat generated at the cutting edge. The benefit is prolonged sharpness and durability of drill, allowing substantially higher speed and feed rates.

**Description:** Used to eject taper shank drills & sockets / sleeves from machine spindles.

## Twisted or broken tangs

Morse taper shanks are defined as self driving, that is they are designed and made to drive off the taper — *not the tang.*

The tang is for ejection purposes only. Tang failures are due to a bad fit between the shank and the socket — thus taking the drive off the taper and putting it on the tang.

## Taper Length Drills

List No. 704

118° Point / Straight Shank / HSS

**Description:** Taper length drills have approximately the same overall flute lengths as taper shank drills. Their shanks are of the same nominal diameter as the drill.

**Application:** Frequently used in lathes and screw machines.

# Screw Extractors

List No. X1

Left Hand / Spiral Flute

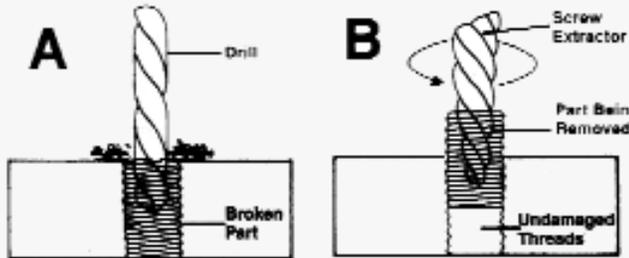

List No. X2

Straight Flute Extractors

**Description:** For the removal of broken screws, studs, bolts or pipe fittings. The left hand rotation of the tapered flutes forces out almost any right hand threaded part. Penetrating oil can be helpful in removing rusty or corroded parts.

X2 extractors are used by first hammering them into the broken bolt.

### To remove a broken screw:

Drill a hole in the broken screw with the recommended diameter drill (fig. A).

Insert the proper screw extractor into the hole and start a counterclockwise (left-hand) rotation (fig. B).

\*Please specify X2 to order straight flute screw extractors

# Carbide Tipped Annular Cutters

List No. CT150

List No. CT200

List No. CT300

List No. CT400

**Description:** Maximize cutting performance of any portable magnetic drill press. Their superior "Triple Edge" cutting action outperforms ordinary high speed steel annular cutters and twist drills 6:1.

**Application:** Cut holes in cast iron, steel and ultra hard or exotic alloys with the added ability to produce overlapping and interrupted holes easily.

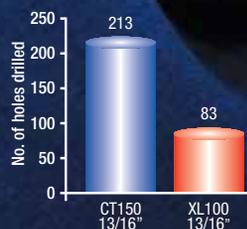

## Time Saving Features

- Ultra hard carbide teeth permit faster cutting even in tough materials and shapes
- Cut clean, bur free holes.
- Precision pilot pins eject the center as a plug of steel.
- Features Weldon style flats for fast loading and better rigidity.

**Triple Edge cutting features**  
The CT series features two sets of three cutting tips each with different geometries, balancing the cutting forces. This enables higher feed rates and smoother drilling, with better control in structural steel and steel plate.

- Help the operator set the precise location to drill
- Guide a steady flow of cutting fluid to the cutting edges
- Eject the slug when the cutter has completed the hole

## Hammer Core Bits

List No. CM89

Carbide Tipped / Heavy Wall / Heat Treated Tool Steel

**Description:** Produce holes significantly larger than the rated power drive. Cutting the circumference of the hole leaves the center as a solid, so concrete removal is reduced for large size holes.

**Application:** Light to medium hard building materials.

Used in rotary hammers operating in the rotary hammer mode. Core bodies are machined from one single piece of steel. Cutting tips are put in at irregular intervals to avoid setting up a sympathetic vibration when producing the hole. Each tooth presents itself to a random & new section of concrete as opposed to the piece previously hit by another tooth.

EDP No./ Diameter	Usable Length	Core Tolerance

- Multiple teeth assure faster cutting and debris evacuation from cutting path.
- Teeth set with negative and positive rake to cut concrete and screening.
- Tooth edges faced to act as secondary cutter area to reduce snagging.
- Centering bit is recommended for best results.

## NEW MERCHANDISING SYSTEM

**iPac Single Packs**

The Champion iPac system provides you with professional grade cutting tools in individual packs. The iPac range includes twist drills, taps, and screw extractors.

### Twist Drills

Brute Platinum XL5 and XL28 mechanics length twist drills outperform standard twist drills. You will get faster hole penetration, and more holes per drill. Provided with a unique combination of premium high speed steel, geometries and NOMO<sup>®</sup> surface treatment. BlackGold XGO drills also available in iPac.

Individual and twin packs available in 29 sizes from 1/16" thru 1/2".

**iPac Combination Packs**

### Combination Taps and Drills

Create new threads and clean up damaged threads. Achieve close tolerances for secure fastening. A range of sizes are available from machine screw #6-32 to 1/2-13. Taps are plug chamfered with 3-5 threads for easy starting. Champion high speed hand taps(Series #308) are professional grade threading tools. Made from industrial grade high speed steel and properly heat treated. The iPac solution matches each tap with the correct twist drill. No more time wasted hunting for the right size twist drill. With iPac the drill and tap are perfectly matched.

Combination packs available in 10 separate application packs from tap size 6-32 thru 1/2-13 with corresponding drill size.

### Combination Screw Extractors and Left Hand Drills

For removing broken bolts, screws and studs. Industrial quality extractors are paired with the perfect twist drill. By pre-drilling using a left-hand mode, the frozen bolt is often loosened for easier removal. Combination screw extractor/twist drill packs available from #1 thru 5.

## Technical Tips / Drills

1. The most common mistake when drilling is to over-speed and under feed the tool. This will generate excess heat at the cutting edge, prematurely dulling the drill. Brute drills are designed to be fed heavily. If speed is increased an increase to feed is also appropriate.  
This will ensure that a “healthy” chip is being formed, and you will achieve good drilling results.
2. The workpiece must be held rigid and the machine spindle should have no play.
3. The chuck in which a straight shank drill is held must be good quality. If the drill slips in the chuck and the feed is automatic, breakage of the drill may occur.
4. Use recommended lubricants to enhance the life of the drill and ensure that the lubricant always reaches the drill point.
5. Do not allow the flutes of a drill to become choked with chips, especially in the holes. When drilling deeper than 4 x diameter, withdrawal of the drill to clear chips may be required.
6. When the drill is reground ensure that all wear is removed and check that the correct point geometry is produced. Always keep drills sharp; frequent regrinding is good economy.

When drilling a particular material at a given speed and feed, the drill's performance is governed by its quality and the following other important factors:

- MATERIAL BEING DRILLED
- DEPTH OF HOLE
- THROUGH OR BLIND HOLE
- COOLANT USED
- CONDITION OF THE MACHINE
- MACHINE POWER CAPACITY
- CHOICE OF TOOL HOLDING
- STABILITY OF WORK HOLDING
- HORIZONTAL OR VERTICAL DRILLING
- STATIONARY OR REVOLVING DRILL
- CHIP CONTROL

### Drill Nomenclature

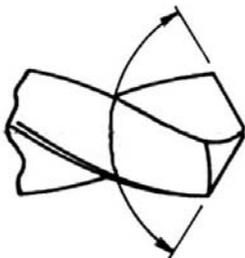

## Trouble Shooting / Drills

1. **OUTER CORNERS BREAK DOWN.**  
Cutting Speed too high / Hard spots in material / No cutting fluid at drill point / Flutes clogged with chips / Drill was used to enlarge an existing hole - Reamer should be used to enlarge holes.
2. **CUTTING LIPS CHIPPED**  
Too much feed / Lip relief too great / Drill was used to enlarge an existing hole - Reamer should be used to enlarge holes.
3. **CHECKS OR CRACKS IN CUTTING LIPS**  
Overheated or too quickly cooled while sharpening or drilling.
4. **MARGIN CHIPS**  
Oversize jig bushing
5. **DRILL BREAKS**  
Point improperly ground / Feed too heavy / Spring or back lash in drill press, fixture or work / Drill is dull / Flutes clogged with chips.
6. **TANG BREAKS**  
Imperfect fit between taper shank and socket caused by dirt or chips, or burred or badly worn sockets.
7. **DRILL BREAKS WHEN DRILLING BRASS OR WOOD**  
Flutes clogged with chips / Improper type of drill
8. **DRILL SPLITS UP CENTER**  
Lip relief too small / Too much feed
9. **DRILL WILL NOT ENTER WORK**  
Drill is dull / Lip relief is too small / Too heavy a web
10. **HOLE ROUGH**  
Point improperly ground or dull / No cutting compound at drill point / Improper cutting fluid / Feed too great / Fixture not rigid
11. **HOLE OVERSIZE**  
Unequal angle or length of the cutting edges - or both / Loose spindle
12. **CHIP SHAPE CHANGES WHEN DRILLING**  
Drill becomes dull or cutting lips chipped
13. **LARGE CHIP COMING OUT OF ONE FLUTE, SMALL CHIP OUT OF THE OTHER**  
Point incorrectly ground, one lip is doing all the cutting.

## Drill Tip Geometry

### 118° Conventional Point

- General use
- Not self centering
- For stationary drills
- performs better in softer materials than hard metal

### 135° Split Point

- Self centering (won't walk)
- For portable drills
- For harder materials
- Requires less force than 118°

## Technical Tips / Taps

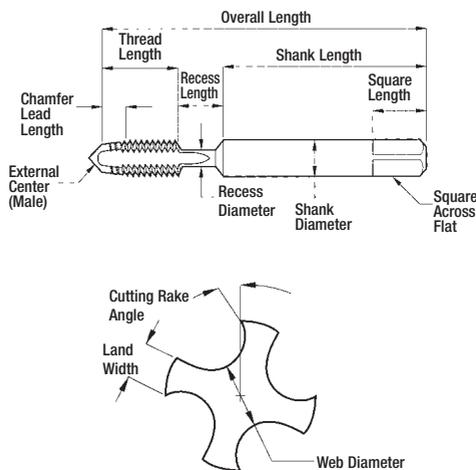

### Spiral point taps

Spiral point taps have straight, shallow flutes and are often referred to as "gun" taps. The gun nose or spiral point is designed to drive the chips forward. The relatively shallow flutes ensure that the sectional strength is maximized. They also act to allow lubricant to reach the cutting edges. This type of tap is recommended for threading through holes and may be used in blind hole applications where there is sufficient space to accommodate the chips.

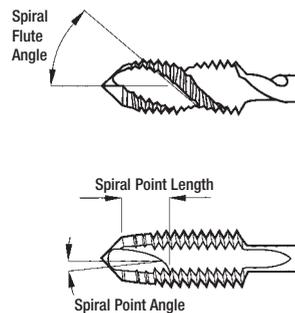

### General hints on Tapping

1. Select the correct design of tap for the component material and type of hole, i.e. through or blind.
2. Ensure the component is securely clamped, lateral movement may cause tap breakage or poor quality threads.
3. Size matters. For optimal performance it is important to use the right size drill before tapping.  
Please call 800-645-3957 to order a free Champion decimal equivalency card (DC-1) card.
4. Select the correct cutting speed.
5. Use appropriate cutting fluid for correct application.
6. In CNC applications ensure that the pitch value chosen for the program is correct. When using a tapping attachment, 95% to 97% of the pitch is recommended to allow the tap to generate its own pitch.
7. Where possible hold the tap in a good quality torque limiting tapping attachment, which ensures free axial movement of the tap and presents it squarely to the hole. It also protects the tap from breakage if accidentally "bottomed" in a blind hole.
8. Ensure smooth entry of the tap into the hole, as an uneven feed may cause "bell mouching".

#### General Information on Bur Use

1. Do not use carbide burs in a portable drill motors. Portable Drill motors run at much lower speeds.
2. It may be recommended to adjust the bur speed as shown under maximum recommended operating speeds for optimum performance.

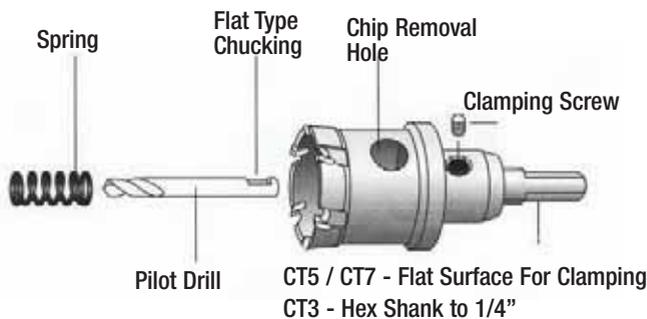

Use slower speeds for harder materials.  
 Use higher speeds when using small burs.  
 Use slower speeds when using long series burs.

3. Running burs below recommended speeds may cause chipping.
4. Do not use worn out tools and collets as they will also cause chipping.
5. Running burs too fast will cause teeth to wear prematurely.
6. Apply constant pressure and movements when in use.

### Technical Tips / Reamers

#### General Hints on Reaming

To obtain the best results when using reamers it is essential to make them "work". It is a common fault to prepare holes for reaming with too little stock left in. If insufficient stock is left in the hole before reaming then the reamer will rub, quickly show wear and will result in loss of diameter. It is equally important for performance not to leave too much stock in the hole.

1. Select the optimum type of reamer and the optimum speeds and feeds for the application. Ensure that pre-drilled holes are the correct diameter.
2. The workpiece must be held rigid and the machine spindle should have no play.
3. The chuck in which a straight shank reamer is held must be good quality. If the reamer slips in the chuck and the feed is automatic, breakage of the reamer may occur.
4. Keep tool overhang from machine spindle to a minimum.
5. Use recommended lubricants to enhance the life of the reamer and ensure the fluid reaches the cutting edges.
6. Do not allow the flutes of a reamer to become blocked with chips.
7. Keep reamers sharp. Frequent regrinding is good economy, but it is important to understand that reamers cut only on the bevel and taper leads and not on the lands. Consequently only these leads need regrinding. Accuracy of regrinding is important to hole quality and tool life.

### Technical Tips / End Mills

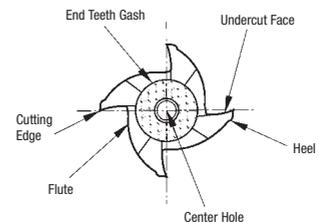

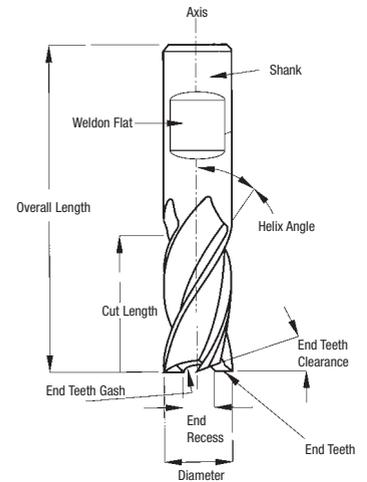

#### General Hints on Milling

A liberal supply of cutting liquid (emulsion) should be used.

Adaptation to the machine tool  
Conventional milling machines usually have a limited number of selectable speed and feed rates.

The recommendations made must therefore be adapted to the values applicable to the machine being used. Adaptation should be done so that the recommended rate of feed per tooth is changed as little as possible.

It is particularly important that the rate of feed per tooth does not increase for diameters < 3/8".

#### Arbor Preparation

When using a drill press, ensure that a support system is in place for the arbor and that it is not worn out.

#### Surface Preparation

The material must be at least 3/8" thick. The machine's magnetic base must be clear of chips and debris and must be securely attached to a clean workpiece. The magnet will be prevented from obtaining optimal holding power if it is used on an uneven surface or there is a large debris buildup. This may cause the drill to shift or lift during operation.

#### Pipe / Convex Surface Drilling

Champion magnetic drill presses can be used to drill such surfaces, but you need a support system. Champion stocks the RB-Saddle for such circumstances.

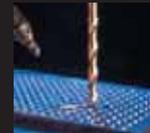

#### Machine Maintenance

For the best performance, always maintain your drill as instructed in your Champion machine operator's manual. Champion magnetic drill presses feature a slide/gibway system that requires periodic adjustments to maintain rigidity and optimal performance. Worn or damaged parts should be replaced to reduce the possibility of injury. Champion stocks a full range of replacement parts.
